

## Dental Patient Health History gives a big-picture view of overall health

When dentists have access to a patient's health history, they have a broader understanding of their overall health. This can help them deliver the right care to your employees. That's why the Dental Patient Health History tool was developed as part of Anthem Whole Health Connection® – Dental.

With Dental Patient History, dentists can view relevant, HIPAA-compliant patient health information online, such as:

- Prescription medications taken.
- Recent medical diagnoses.
- Lab test results.
- Care gap alerts.
- Care Management program participation.

By connecting the dots between an employee's claims or care management programs and their medical history, health professionals can identify possible gaps in care. Dentists can view online care gap alerts about patients and provide education on the dental health complications of certain prescriptions or recommend additional preventive dental care such as fluoride or sealants.

We are here to support your employees' overall health. To learn more about Dental Patient Health History, contact your broker or Anthem representative or visit [anthem.com/specialty](https://www.anthem.com/specialty).
